Key takeaways

1 Fixed income is suited for active management

The fixed income market is large, complex and prone to inefficiencies requiring investors to account for a multitude of factors, including interest rate sensitivity and credit risk. Active managers can navigate these challenges for investors and potentially deliver higher yields and better risk management compared to well-known benchmarks.

2 The growing influence of ETFs in the fixed income market

The ETF structure for fixed income was one of the most consequential developments in two decades because it provides investors with a liquid investment vehicle in a market not always known for its liquidity. The ETF structure also offers cost efficiencies that mutual funds and other vehicles may lack.

3 The future of fixed income ETFs is here, and it's active

Without the constraint of replicating an index, the ETF structure offers active managers the flexibility to tailor and optimize investments. This flexibility enhances liquidity management, which has proven crucial during market stress. It will also be important in the current interest rate environment.

In recent decades, the fixed income market has undergone significant transformation in terms of size, use cases and methods of execution. One of the most transformative developments has been the introduction of a diverse range of exchange-traded funds (ETFs), which have enhanced liquidity to the global fixed income market. ETFs are a modern structure that equip managers with new tools to effectively manage portfolios, making it simpler to capture market inefficiencies and access segments not available through passive index strategies.

Fixed income ETFs are a large and growing market

The widespread electronification of the bond market in the early 2000s and the Securities and Exchange Commission's (SEC) Rule 6c-11 in 2019, better known as the ETF Rule, were catalysts for the modernization of the bond market and created on-ramps for new debt instruments. Fixed income ETFs started in 2002 as passive vehicles utilized as low fee building blocks by asset allocators and model managers to complete portfolios. The next evolution of the market has been marked by the rapid growth of actively managed fixed income ETFs.

By 2030, we forecast the global fixed income ETF market to grow to \$6 trillion and the active fixed income ETF market to grow to \$1.7 trillion, with the U.S. market capturing a significant portion of that growth. The Federal Reserve's (Fed) cutting cycle is one reason why the current environment is conducive for further growth. Historically, the Bloomberg U.S. Aggregate Index averaged a cumulative 20% return over the 24 months following a final rate increase.

Global fixed income ETF assets have grown six times in the past ten years to \$2.5 Trillion

Why active fixed income

The fixed-income market, characterized by a wide range of debt issuances differing in maturity, quality, and type, is vast, intricate, and contains structural inefficiencies.

The global fixed income market is about \$141 trillion in size, encompassing over 3 million unique securities, in comparison, the \$115 trillion global equity market includes only 9,000 securities.

When investing in fixed income, investors must account for interest rate sensitivity, credit risk, liquidity, structural market inefficiencies, concentrations in portfolios to the most indebted issuers. Whereas passive fixed income strategies must absorb these challenges, active managers have the freedom to navigate them. Active management has been proven effective, with 80% of core and core plus managers outperforming the Bloomberg U.S. Aggregate Index over the past five years.

Fixed income investing presents challenges

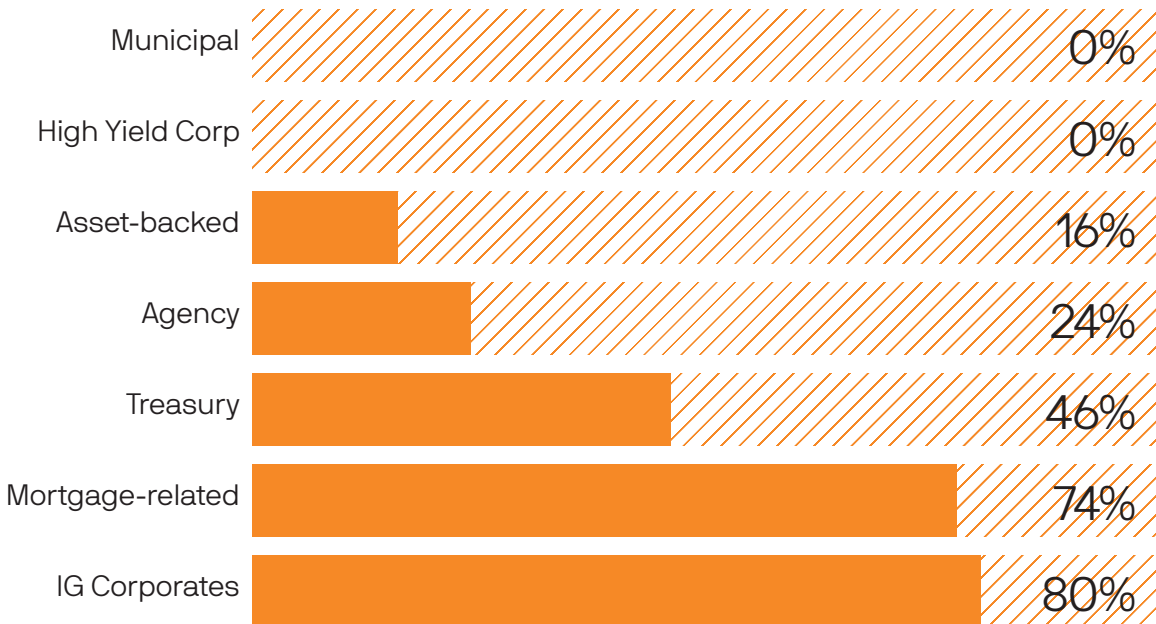

Achieving meaningful diversification is complex

Buying individual bonds for a portfolio requires a significant amount of time, knowledge and capital. Benchmark replication often requires sampling and leads to variations in the underlying bonds. To that end, even passive ETF strategies have an active component, given the basket of securities is strategically optimized relative to the benchmark. For instance, the three largest passive core fixed income ETFs hold an average of 83% of the holdings of the underlying index they track.

Another obstacle to achieve diversification is that fixed income benchmarks are becoming outdated due to their rule-based construction. For example, the Bloomberg U.S. Aggregate Index is often viewed as representing the U.S. bond market, yet it excludes about 47% of the \$53 trillion U.S. public bond market (**Exhibit 3**). Certain asset classes, such as high yield corporates and non-agency mortgage-backed securities are excluded, while others, such as asset-backed and agency securities, have only limited exposure within the index. A large part of the growing securitized market is completely excluded.

Nearly half of the U.S. bond market is not represented in the Bloomberg U.S. Aggregate Index

Exhibit 3: Segments of the \$53 trillion U.S. bond market

Active management provides exposure to skill, flexibility and options

Research is a game changer

Active managers can be selective in the debt issuers that they hold and adjust top-down positioning, including sector rotation, duration exposures and overall portfolio risk positions based on changing market conditions. They can analyze correlations among asset classes and interest rate sensitivity of different sectors. To assess the merits of one sector over another and compare opportunities across different markets, active managers typically leverage a research framework that combines:

Fundamental analysis

Macroeconomic data, such as growth and inflation, and corporate health figures, such as default rates, earnings and leverage metrics

Quantitative analysis

Spreads, yields and other measures that determine the extent to which a sector or security is rich or cheap—on an absolute basis, versus history and relative to other sectors

Technical analysis

Supply and demand dynamics (issuance, maturities and flows), and investor positioning, sentiment, and liquidity

Expanded opportunity sets

Instead of strictly following an index, active managers can invest in an expansive universe and find more opportunities to generate alpha (**Exhibit 4a**).

Managers have the flexibility to seek out meaningful returns in areas of the fixed income market that are typically inaccessible to everyday investors, such as the securitized and high-yield markets (**Exhibit 4b**).

Active fixed income gives investors exposure to more opportunities and potential spread capture

Exhibit 4a: Spread advantage from incorporating securitized and high yield credit

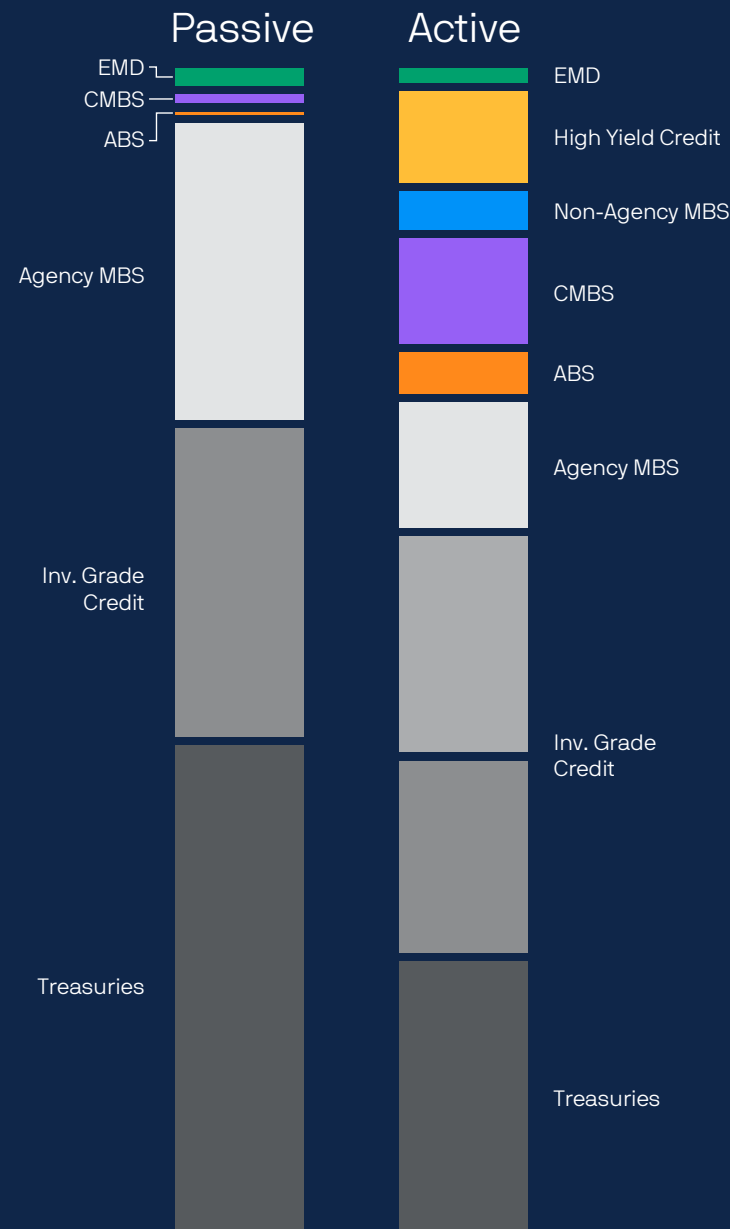

Exhibit 4b: Expanded asset class opportunities for active management

Securitized

Agency MBS

- + Agency mortgage-backed securities (MBS) is the largest segment in the securitized market.
- + The Fed's quantitative easing during the pandemic significantly impacted agency MBS valuations, creating opportunities for active managers.
- + Active managers can select specific collateral profiles and agency collateralized mortgage obligations to optimize portfolio convexity and duration stability.
- + To assess whether bonds or bond attributes are priced below their intrinsic value requires detailed analysis.

Securitized Credit

- + The securitized credit subset carries credit risk, requiring a dedicated research team to underwrite each deal.
- + Debt outstanding in this market totals over \$3 trillion, but nearly 90% of it is not represented in the Bloomberg U.S. Aggregate Index.
- + This market is diverse, offering exposure to residential and commercial mortgages and business and consumer loans.
- + Auto asset-backed securities, for example, are backed by auto loans and offer multiple classes (tranches) with varying credit ratings.
- + Securitized credit sectors can provide a material spread advantage over comparable credit quality corporate debt.

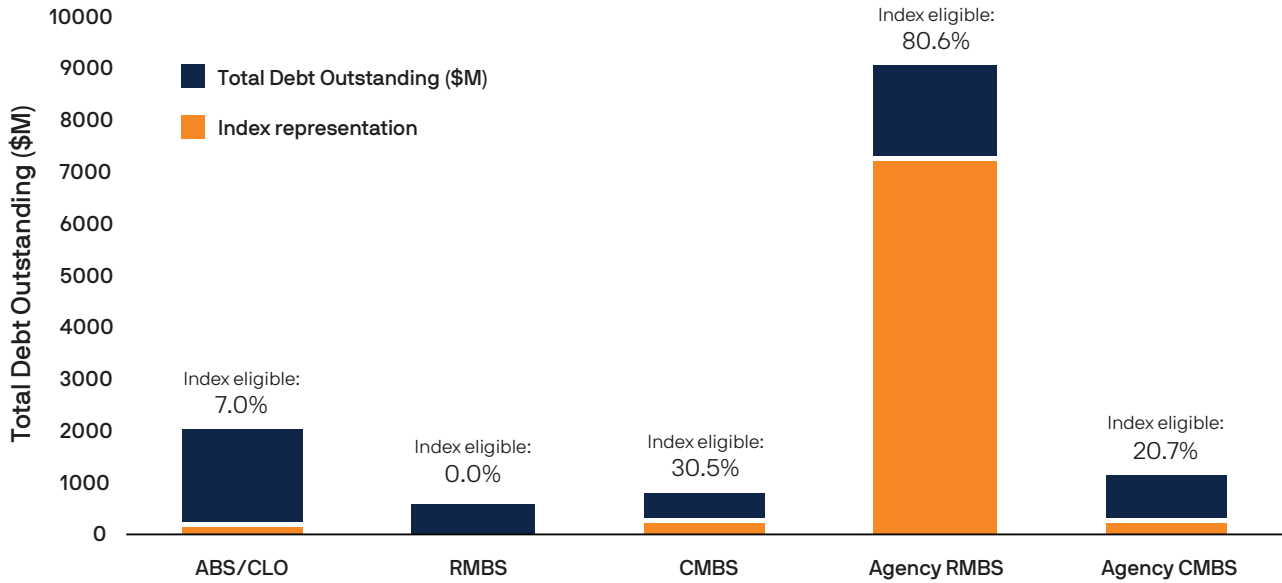

High Yield

- + The asymmetrical return profile of high yield bonds makes active management crucial.
- + CCC bonds can be volatile, and passive ownership may not add to long-term performance. Defaults are a risk.
- + CCCs account for approximately 15% of the high yield market. One-third of the total CCC index trades with a spread greater than 1000bps, a traditional barometer for stressed credit.
- + Active managers can avoid defaults and achieve higher recoveries through strong security selection and expertise in restructurings.
- + Certain high yield sectors, such as energy, have had volatile stretches, but active managers can avoid sectors without compelling relative value.
- + Passive exposure to highly leveraged companies in secularly challenged businesses can result in credit loss, whereas active managers can navigate these risks.

Passive investors do not have access to about 25% of the \$13.2 trillion securitized market

Proof is in the performance and active managers have outperformed

Over trailing 3-, 5-, and 10-year periods, active core plus and active core managers deliver average annualized net of fee returns that exceed those of the Bloomberg U.S. Aggregate Index. However, manager selection is vital, given the wide dispersion in returns between the top- and bottom-performers. Past performance is not indicative of future results, but identifying managers with well-established research philosophies, processes, and experience across market cycles can increase the chances of positive outcomes.

Active fixed income managers typically outperform passive strategies, though there is a wide dispersion of returns between top and bottom managers

Why ETFs for active fixed income

ETFs revolutionized fixed income markets because they provide a quick, simple and reliable way to access bond markets. While ETFs represent less than 2% of the total \$141 trillion global bond market, they are an emerging growth story with significant momentum. They have an impressive track record of adding liquidity, particularly during times of market stress, a point that increasingly resonates with investors. The benefits we discuss below collectively provide flexibility, positioning ETFs as a modern structure that resolves many issues inherent in the mutual fund structure. Stemming from their liquidity and transparency, ETFs offer several advantages to investors, portfolio managers, and the overall market.

Benefits of the ETF structure

The externalization of trading costs

ETFs and mutual funds aggregate assets from many investors, providing access to a diversified portfolio that may not be achievable through individual investments or SMAs. While ETFs and mutual funds offer benefits of scale, an important distinction between the two is that the transaction costs for buying and selling mutual funds are borne by all shareholders. Conversely, ETF transaction costs are borne only by the individual investor entering or exiting the fund.

ETFs provide additional tools for our portfolio managers to more effectively invest in the best interests of our clients.

Bob Michele, CFA

Head of Global Fixed Income,
Currencies & Commodities

For example, when an investor places an order to purchase shares of a mutual fund, cash is delivered into the fund to be invested across securities in the portfolio. Transaction costs incurred from investing this cash reduces the end-of-day net asset value (NAV). With ETFs, share creations are received in-kind or via cash with a fee assessed to cover the cost to purchase underlying securities in order to not negatively affect the fund's NAV. Therefore, when an investor buys shares of an ETF, they do so in the secondary market at prices that already reflect these transaction costs. This structure isolates any realized cost to the shareholder buying or selling the ETF and insulates the NAV from other shareholder's trading activity.

Lower all-in costs than mutual funds

As trading volume increases, bid-ask spreads often tighten, leading to lower transaction costs for investors. **Exhibit 8** highlights the top 10 U.S. high yield ETFs within Morningstar's High Yield category and approximates the cost investors pay to enter and exit an ETF compared to the costs associated with buying and selling the tradable universe of underlying bonds. ETFs delivered an average spread of 3.5 basis points versus 26 basis points for the underlying high yield securities. During periods of market stress, ETF spreads have been significantly tighter than basket spreads, including during the COVID-19 pandemic. This trend was especially evident in less liquid fixed income segments, such as high yield bonds. Trading volume in ETFs increased during these periods, while it declined in the high yield bond market. In addition to spread savings, ETFs generally offer lower total expense ratios than mutual funds.

ETF creations received in-kind or via cash with a fee assessed to cover the cost to purchase underlying securities do not negatively affect the fund's NAV.

Greater liquidity, especially during market stress

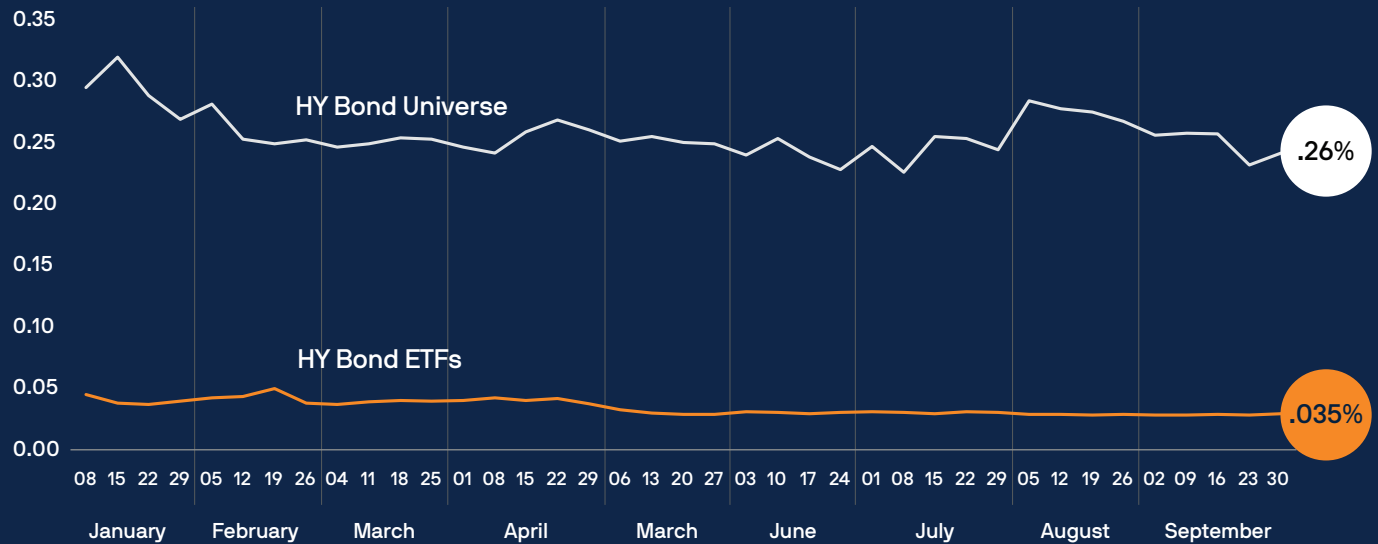

ETFs trade on exchanges, where investors can buy or sell shares at readily available prices throughout the day. The exchanges serve as centralized markets to match trading partners efficiently and transparently, and every dollar traded that does not flow into the primary market is considered additional liquidity. In fact, when looking at the top 10 U.S. high yield ETFs, approximately 13% of their volume led to primary market flows.

Secondary markets can also facilitate large trades. Where robust secondary volumes exist with narrow bid-ask spreads, large trades can be executed at minimal costs. When additional liquidity is needed, market makers can tap the primary market to create or redeem shares, enabling them to offer more liquidity than an ETF's average daily volume (**Exhibit 9**).

When looking more closely at liquidity across U.S. high yield bonds and ETFs during various periods of stress, we find that more volume was transacted in the secondary market than in the ETF's underlying securities. Despite this relationship, ETF trading in the underlying bonds still represents on average less than 5% of trading in the total U.S. high yield bond market, debunking a popular myth that ETF volume materially impacts its underlying securities market. In addition, during periods of inflation concerns in 2022 and 2023, secondary market trading of the U.S. high yield ETF market represented nearly 50% of the total U.S. high yield trading volume during this period, despite primary volume from these ETFs representing less than 10% of the total U.S. high yield market volume.

High yield bond ETFs have tighter spreads than underlying high yield bonds

Price discovery

Premiums and discounts are a normal occurrence across all ETFs. In fixed income ETFs, premiums are often more prevalent as most issuers mark their NAVs at the bid side of the underlying bonds. While other factors can lead to premiums such as investor positioning and underlying transaction costs, the fact that a premium exists provides valuable intelligence about where the bonds in the portfolio are trading. This is referred to as price discovery.

This intraday price discovery brings efficiencies, which are often more noticeable in less liquid sectors of the fixed income market and during times of market stress. During these periods, an ETF may trade at an elevated premium or discount level, but this market price is often quicker to react and a more accurate reflection of the underlying bond values than its NAV.

Nasdaq's report, "Bond Markets vs. Bond ETFs During COVID," highlights a Bank for International Settlements (BIS) study that found ETF NAVs become "stale" during market stress. The study suggests that ETFs, with their continuous trading and liquidity, absorb information faster than NAVs. Instead of indicating problems with ETFs, the price divergence shows that ETFs are superior for price discovery, while bond market prices are outdated and less accurate (**Exhibit 11**).

Portfolio management

Secondary markets can serve as an efficient mechanism for alleviating turnover in the underlying bond portfolio. Less turnover means less trading costs which can eat into a fund performance. In addition, portfolio managers do not have to continue to source similar bonds, especially as prices change. Based on trading data for the high yield funds mentioned in Exhibit 8, from a nine-month period ending September 2024, only approximately \$1.30 out of every \$10 transacted on exchange resulted in a flow to the primary market in the form of a creation or redemption. This means that 13% of investor trading activity in the ETF wrapper led to trading by the portfolio manager. This percentage is often reduced further during market stress and prevents portfolio managers from having to trade at inopportune times.

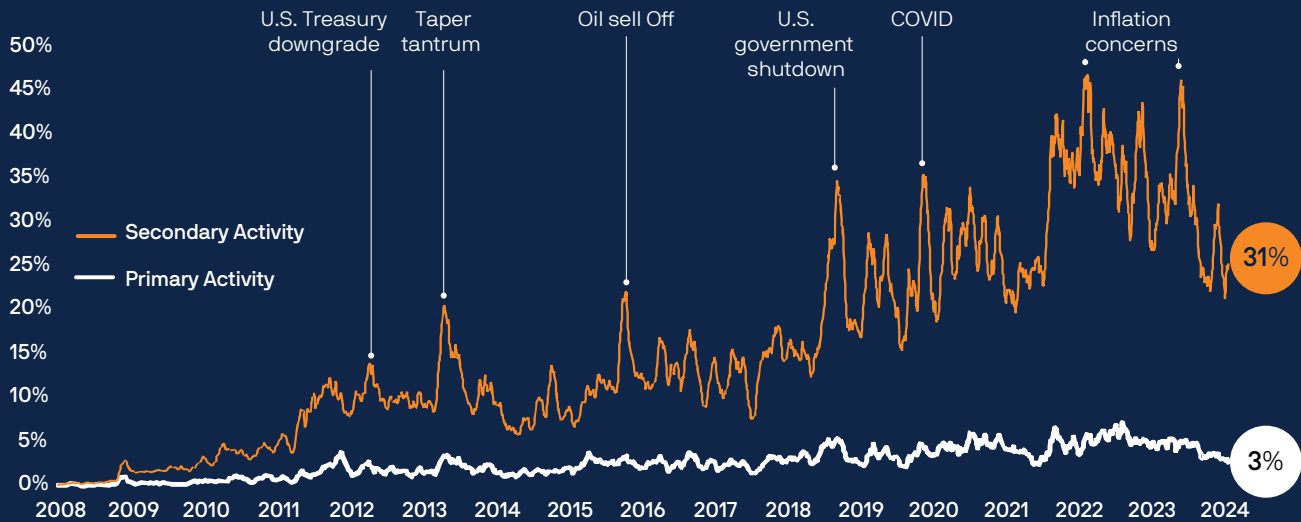

For products that utilize the in-kind mechanism, portfolio managers can manage the underlying portfolio's composition by accepting the delivery of bonds for creations and distributing certain bonds during redemptions. These transactions can further reduce the portion of the flow that portfolio managers would otherwise need to trade, increasing the size of a flow that they can accept into or deliver out of the fund without incurring higher transaction costs.

Daily transparency and access

Most ETFs disclose their holdings daily, whereas mutual funds typically disclose holdings monthly or quarterly. Additionally, mutual funds have up to 60 days after the end of a quarter to publish their holdings, which can result in a delay of up to two months for investors to see the fund's allocation. Daily disclosure of ETF holdings provides a clear view of the underlying securities and enables investors to easily perform portfolio attribution to analyze their investment's performance. SMAs may provide similar daily transparency, but they often require higher investment minimums and possibly larger management fees. ETFs simply require access to a brokerage account and enough funds in their account to purchase one share.

During market stress, transaction volumes tend to be higher in the secondary market than in high yield bond ETFs' underlying securities

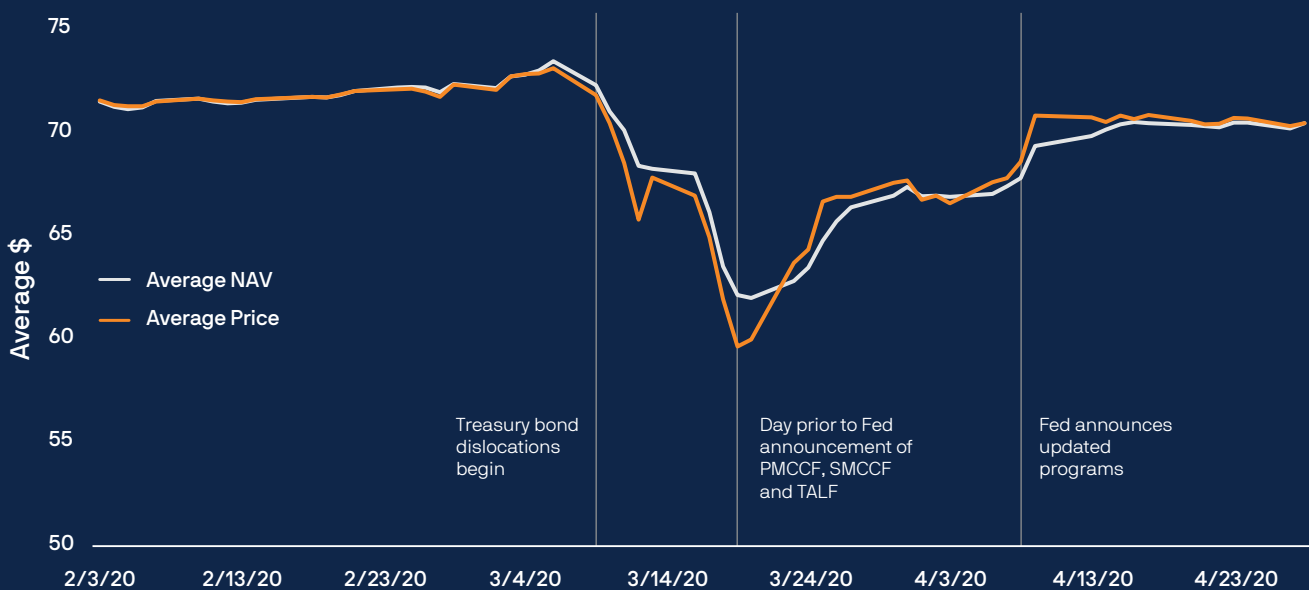

Exhibit 10: High yield bond ETF trading volume as a percentage of 20-day rolling trading volume of the overall high yield bond market

Source: Bloomberg, J.P. Morgan Asset Management. High yield ETF market is represented by HYG, JNK, PHB, HYL, SJNK, SHGY, USHY, HYL, ANGL, HYS, BSJL, BSJM, BSJK and BBHY. High yield bond market is represented by FINRA TRACE Market Breadth high yield Bond Dollar Volume (NTMBHV) and FINRA TRACE 144a HY \$ Vol (NTMB4HYV). Data as of 9/30/2024.

Fixed income ETFs have been effective price discovery tools, with secondary market pricing generally being more actionable and leading NAVs, especially in stressed markets

Exhibit 11: Investment grade bond ETF average price and average NAV during the COVID-19 pandemic

Why active fixed income ETFs now

+

The global fixed income market is at a pivotal moment, offering unique opportunities for diversification, which can be accessed through actively managed ETFs.

+

Managing active fixed income ETFs provides managers with new tools, including the ability to capitalize on market inefficiencies, access a broader range of market sectors, and improve liquidity management.

The high trading volumes associated with ETFs allow portfolio managers to focus on their core expertise: managing portfolios for the benefit of shareholders.

+

ETFs have played a pivotal role in modernizing the fixed income market. With the global interest rate cycle at a turning point, actively managed fixed income ETFs are becoming an increasingly utilized solution for investors.
